

Day 1 - Exercise 2:

I completed Exercise 2 by forking the original repository, which can be found [here](#). Following the instructions, I created a new branch and added a file titled "Potato Salad" with incomplete instructions. Then, I made a small change to the "Fruit Salad" file in the main branch. After that, I merged the two branches in my forked repository. Finally, I submitted a pull request to the base repository, and the maintainer accepted my contribution. At the end of Day 1, I pulled all the new contributions to the forked repository. Through this exercise, I learned how to fork projects, contribute to them, and work on different branches.

Day 2 - Exercise 3

I created [this repository](#) and stored the documents requested for the certificate. It includes 3 documents: exercises, Questions, and reflections. Today, I practiced working with a local directory and learned tools to explore a Git repository.

Day 3 - Exercise 1

I sent the [pull request](#) to the main branch to add a potato salad recipe. I first created an issue, then a branch to address the issue, and after committing changes, I sent the request. I also reviewed pull requests from other people and merged their contributions.
